The safe & effective use of chemically protected urea products

Yara has produced this information leaflet on chemically protected urea products, to promote their safe and effective use. The term 'chemically protected' urea refers to urea fertilizers that have been treated with a urease inhibitor.

Shelf Life

The storage period can influence the effectiveness of the product. Refer to your supplier for shelf life and seek assurance that the product meets EU fertilizer standards.

Handling

Personnel Protective Equipment should always be worn by persons handling chemically protected urea products.

Recommended turnout

Grazing should only take place when fertilizer is no longer visible on the ground. Care must be taken that all fertilizer spreader washings are collected and land applied in compliance with Nitrate Regulations.

Optimal use

The appropriate fertilizer spreader setting should be chosen before any chemically protected urea product is applied. This will ensure that the chosen application rate is achieved across the full bout width.
